HemoCue® Hb 801 Microcuvettes, 4x50 Microcuvettes

HemoCue Hb 801 System consists of HemoCue Hb 801 Analyzer and HemoCue Hb 801 Microcuvettes. Read and follow this package insert together with the operating manual (provided with the analyzer), for optimum performance and safety. For more information, contact the local distributor or HemoCue America.

Only use HemoCue Hb 801 Analyzer together with HemoCue Hb 801 Microcuvettes.

Intended Use
The HemoCue Hb 801 System is intended for the quantitative determination of hemoglobin in capillary or venous whole blood (K₂EDTA and Li-Heparin) in point-of-care settings. The HemoCue Hb 801 System is intended to be used to determine the hemoglobin concentration for adults, adolescents, children, and infants above 1 month old. The HemoCue Hb 801 System is for professional in vitro diagnostic use only.

IVD Medical Device Directive
The HemoCue Hb 801 Microcuvettes comply with the IVD Medical Device Directive 98/79/EC and carry the CE mark.

Composition
The microcuvettes are made of polystyrene plastic, and contain no active ingredients.

Precautions
Always wear protective gloves. Handle blood with care, as it may be infectious. Follow local safety procedures for disposal of used microcuvettes. HemoCue Hb 801 Microcuvettes are for single use only.

For system information regarding precautions, read the operating manual.

Storage and Handling
Store the microcuvettes in 10–40 °C (50–104 °F). Microcuvettes in the vial (opened or unopened) are stable until expiration date, printed on the package. Use the microcuvettes prior to expiration date. Microcuvettes in the vial (opened or unopened) can be stored for a shorter period of time (6 weeks) between -18–50 °C (0–122 °F).

Keep all unused microcuvettes in the original package.

Measuring
Operating temperature for HemoCue Hb 801 System is 10–40 °C (50–104 °F). For proper use of the system, read the operating manual regarding measuring capillary and venous samples, measuring control material, cleaning and disinfection, principle of method, and technical specifications.

Make sure the microcuvette is completely filled before measuring. Immediately after filling, insert the microcuvette into the analyzer to perform a measurement. Do not let more than 40 seconds pass.

Quality Control
The HemoCue Hb 801 Analyzer has an internal quality control, a self-test. For more information, read the operating manual. If an external quality control is required by local or other regulations, use quality control material: Eurotrol HemoTrol® Duo or Eurotrol HemoTrol® WB. Only use controls recommended by HemoCue.
Expected Values
Due to a wide range of conditions (dietary, geographical, etc.), which affect normal values, it is recommended that each laboratory establishes its own normal range. For general guidance to normal reference values applicable to most healthy adults and children, see reference ranges below.

Non-interfering Substances

The following substances have been tested according to CLSI EP07 at hemoglobin concentrations 10±0.5 and 20±1.0 g/dL. No interference was found at following concentrations of the substances tested.

</tbody>
</table>

* Multiple concentrations of MetHb up to 25% were tested and do not interfere with hemoglobin measurement at Hb-level 10±0.5 or 20±1.0 g/dL.

Normal blood pH and above, up to 8, at Hb level 10±0.5 or 20±1.0 g/dL do not interfere with the system. The test has been performed according to CLSI EP07.

Limitations
a) Start the measurement immediately after filling the microcuvette. Do not let more than 40 seconds pass.

b) Venous samples (K<sub>2</sub>EDTA or Li-Heparin) can be stored and transported for up to 24 hours in room temperature or refrigerator, before measuring.

c) The following substances have been tested according to CLSI EP07 to determine the interfering concentration.

<table>
<thead>
<tr>
